# Outline

- Transmission
- **ID**entification
- ID Codes
- Remarks

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(\mathbf{u}_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(\mathbf{u}_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$$\mathbf{u}_i \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$$

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(\mathbf{u}_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$$\mathbf{u}_i \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$$

$$W^n(\mathcal{D}_i | \mathbf{u}_i) \geq 1 - \lambda$$

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(\mathbf{u}_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$$\mathbf{u}_i \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$$

$$W^n(\mathcal{D}_i | \mathbf{u}_i) \geq 1 - \lambda$$

$$\mathcal{D}_i \cap_{i \neq j} \mathcal{D}_j = \emptyset$$

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(\mathbf{u}_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$$\mathbf{u}_i \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$$

$$W^n(\mathcal{D}_i | \mathbf{u}_i) \geq 1 - \lambda$$

$$\mathcal{D}_i \cap_{i \neq j} \mathcal{D}_j = \emptyset$$

Capacity

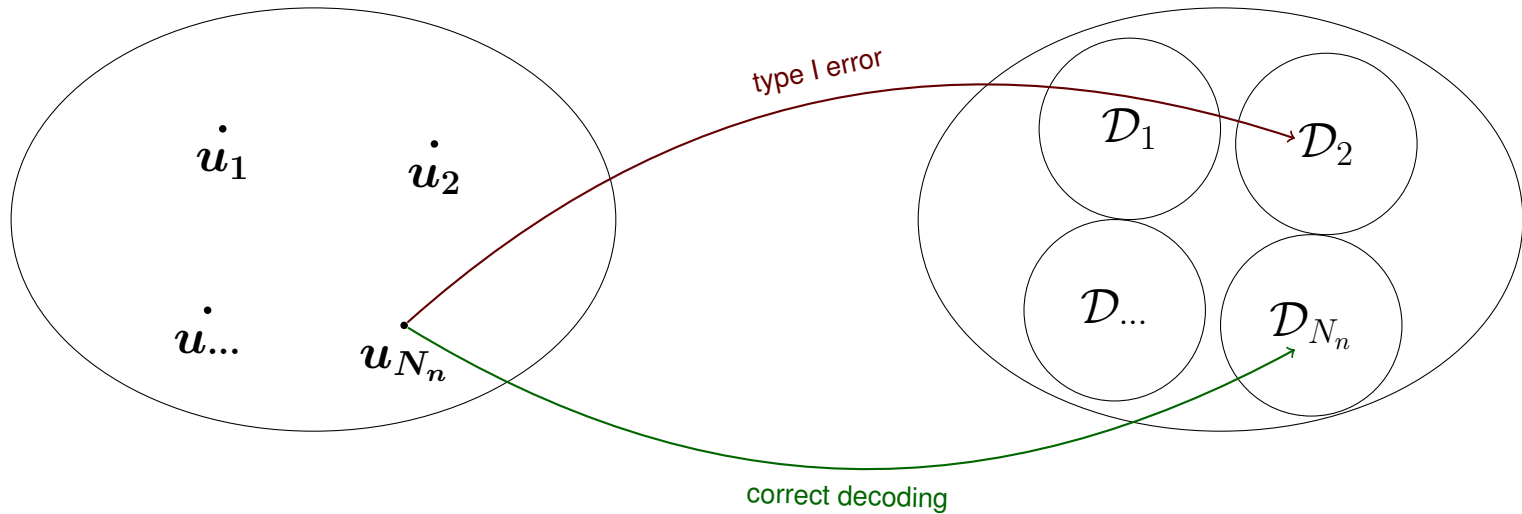

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log N_{max}(n, \lambda) = C_T \quad \forall \lambda \in (0, 1)$$

# Transmission

**(Shannon 1948):**

Transmission  $(n, N_n, \lambda)$  code for  $W$  is a system  $\{(u_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

**Figure:** Geometric depiction of Transmission code

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$$Q_i = \varphi_n(i) \rightarrow \text{codeword of message } i$$

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$Q_i = \varphi_n(i) \rightarrow$  codeword of message  $i$

$Q_i(x^n) = Pr\{X^n(i) = x^n\}, x^n \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$

$Q_i W^n \rightarrow Pr\{Y^n(i) = y^n\}$  (response of  $Q_i$ )

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$Q_i = \varphi_n(i) \rightarrow$  codeword of message  $i$

$Q_i(x^n) = Pr\{X^n(i) = x^n\}, x^n \in \mathcal{X}^n, \mathcal{D}_i \subset \mathcal{Y}^n$

$Q_i W^n \rightarrow Pr\{Y^n(i) = y^n\}$  (response of  $Q_i$ )

$\mu_n^{(i)} = Q_i W^n(\mathcal{D}_i^c) = Pr\{Y^n(i) \in \mathcal{Y}^n \setminus \mathcal{D}_i\} \xrightarrow{\text{type I error}} \mu_n = \max_{1 \leq i \leq N_n} \mu_n^{(i)}$

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$Q_i = \varphi_n(i) \rightarrow$  **codeword** of message  $i$

$Q_i(x^n) = Pr\{X^n(i) = x^n\}$ ,  $x^n \in \mathcal{X}^n$ ,  $\mathcal{D}_i \subset \mathcal{Y}^n$

$Q_i W^n \rightarrow Pr\{Y^n(i) = y^n\}$  (**response** of  $Q_i$ )

$\mu_n^{(i)} = Q_i W^n(\mathcal{D}_i^c) = Pr\{Y^n(i) \in \mathcal{Y}^n \setminus \mathcal{D}_i\} \xrightarrow{\text{type I error}}$

$\mu_n = \max_{1 \leq i \leq N_n} \mu_n^{(i)}$

$\lambda_n^{(i,j)} = Q_j W^n(\mathcal{D}_i) = Pr\{Y^n(j) \in \mathcal{D}_i\} (j \neq i) \xrightarrow{\text{type II error}}$

$\lambda_n = \max_{1 \leq j, i \leq N_n, j \neq i} \lambda_n^{(j,i)}$

# Identification

(Ahlswede & Dueck 1989):

$(n, N_n, \mu_n, \lambda_n)$  ID code for  $W$  is a system  $\{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N_n \rrbracket}$ :

$Q_i = \varphi_n(i) \rightarrow$  codeword of message  $i$

$Q_i(x^n) = Pr\{X^n(i) = x^n\}$ ,  $x^n \in \mathcal{X}^n$ ,  $\mathcal{D}_i \subset \mathcal{Y}^n$

$Q_i W^n \rightarrow Pr\{Y^n(i) = y^n\}$  (response of  $Q_i$ )

$\mu_n^{(i)} = Q_i W^n(\mathcal{D}_i^c) = Pr\{Y^n(i) \in \mathcal{Y}^n \setminus \mathcal{D}_i\} \xrightarrow{\text{type I error}}$

$\mu_n = \max_{1 \leq i \leq N_n} \mu_n^{(i)}$

$\lambda_n^{(i,j)} = Q_j W^n(\mathcal{D}_i) = Pr\{Y^n(j) \in \mathcal{D}_i\} (j \neq i) \xrightarrow{\text{type II error}}$

$\lambda_n = \max_{1 \leq j, i \leq N_n, j \neq i} \lambda_n^{(j,i)}$

$$N_n \leq 2^{|\mathcal{Y}^n|}$$

# Identification

(Ahlswede & Dueck 1989):

## missed ID (due to channel noise)

Alice sent message  $i$ , Bob who is interested in test message  $i^*$  can decide  $i^*$  was not sent

## false ID (inherent to the code)

Alice sent message  $j$ , Bob who is interested in test message  $j^*$  can decide message  $i \neq j$  was sent

# Identification

(Ahlswede & Dueck 1989):

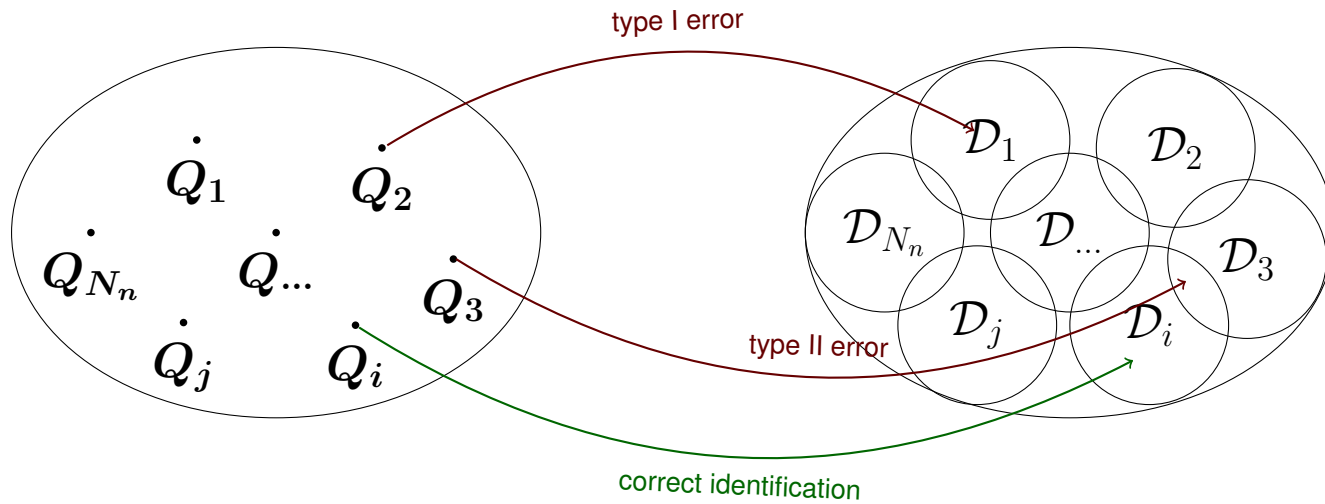

Figure: Geometric depiction of ID code

# Identification Theorems

## Rate

$$r_n \triangleq \frac{1}{n} \log \log N(n, \mu_n, \lambda_n) \quad (1)$$

## Capacity

$$C_{ID} = \lim_{n \rightarrow \infty} \frac{1}{n} \log \log N_{max}(n, \mu_n, \lambda_n) \quad (2)$$

## Direct Part

$$\liminf_{n \rightarrow \infty} r_n \geq C_T \quad \forall \mu_n, \lambda_n \in (0, 1] \quad (3)$$

## Soft Converse

$$\limsup_{n \rightarrow \infty} r_n \leq C_T \quad \mu_n, \lambda_n \leq 2^{-n\varepsilon} \quad \forall \varepsilon > 0 \quad (4)$$

## Strong Converse (Han & Verdu 1992)

$$C_{ID} \leq C_T \quad \forall \mu_n, \lambda_n \geq 0 \quad \& \quad \limsup_{n \rightarrow \infty} (\mu_n + \lambda_n) < 1 \quad (5)$$

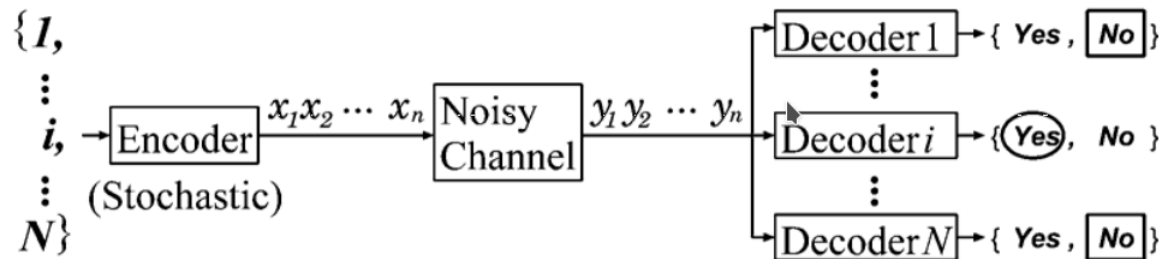

# Transmission vs Identification

## Transmission

We can transmit  $M = e^{nR}$  messages.

## Identification

We can identify  $N = e^{e^{nR}}$  messages!

Figure: difference between Transmission and Identification <sup>1</sup>

<sup>1</sup>Y. Oohama, "Converse coding theorems for identification via channels," IEEE Trans. Inform. Theory, vol. 59, pp. 744-759, Feb. 2013.

# Application

- **Scenario** → Radio Networks, LAN, and Downlink Satellite Communications
- **Goal** → Delivery a sequences of messages, each intended for one receiver

# Application

- **Scenario** → Radio Networks, LAN, and Downlink Satellite Communications
- **Goal** → Delivery a sequences of messages, each intended for one receiver

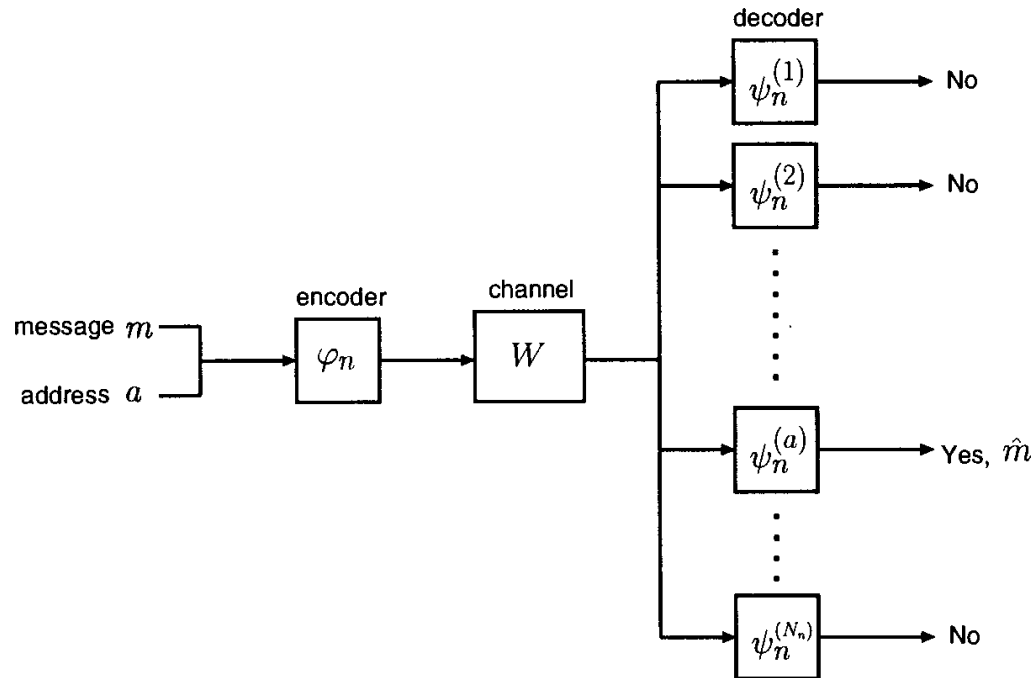

Figure: realization of identification-transmission communication <sup>2</sup>

<sup>2</sup>adopted from "Information-Spectrum Methods in Information Theory", T. S. Han, Tokyo, 2003, p. 436.

# Construction 1 (Random Coding Argument)

**(Ahlswede & Dueck):**

- **Shannon's coding theorem** guarantees existence of two transmission codes:

$$\begin{aligned}
 - \mathcal{L}' &= \{(\mathbf{u}'_j, \mathcal{D}'_j) | j \in \llbracket M' \rrbracket\} \quad / \quad (n, \lceil 2^{n(C-\varepsilon)} \rceil, 2^{-n\delta}) \\
 - \mathcal{L}'' &= \{(\mathbf{u}''_k, \mathcal{D}''_k) | k \in \llbracket M'' \rrbracket\} \quad / \quad (\lceil \sqrt{n} \rceil, \lceil 2^{\varepsilon\sqrt{n}} \rceil, 2^{-\sqrt{n}\delta})
 \end{aligned}$$

- Let  $\mathcal{T}$  be a family of maps  $\mathcal{T} = \{T_i | i \in \llbracket N \rrbracket\}$  where  $T_i : \llbracket M' \rrbracket \rightarrow \llbracket M'' \rrbracket$

- Let  $\mathcal{U}_i := \{\mathbf{u}'_j \cdot \mathbf{u}''_{T_i(j)} | j \in \llbracket M' \rrbracket\}$  and  $\mathcal{D}_i = \bigcup_{j=1}^{M'} \mathcal{D}'_j \times \mathcal{D}''_{T_i(j)}$

- Let  $Q(i)$  be uniform distribution on set of codewords  $\mathcal{U}_i$

- Obviously  $\mathcal{ID}_{\mathcal{L}', \mathcal{L}''} = \{(Q_i, \mathcal{D}_i)\}_{i \in \llbracket N \rrbracket}$  is an  $(n + \sqrt{n}, N, \lambda_1^{\mathbb{L}', \mathbb{L}''}, \lambda_2^{\mathbb{L}', \mathbb{L}''})$  ID code.

# Construction 1 (Random Coding Argument)

**(Ahlsvede & Dueck):**

- Let  $\forall i \in \llbracket N \rrbracket$  and  $\forall j \in \llbracket M' \rrbracket$ ,  $U_{ij}$  be independent RVs s.t.  
 $\Pr\{U_{ij} = \mathbf{u}'_j \cdot \mathbf{u}''_k\} = \frac{1}{M''}, \quad \exists T^* \in \mathbf{T}$  s.t.  $T_i^*(j) = k \in \llbracket M'' \rrbracket$
- Let **random set**  $\bar{\mathbf{U}}_i = \{U_{i1}, \dots, U_{iM'}\}$  be a vector of concatenated codeword
- Let **random decoding set**  $\mathcal{D}(\bar{\mathbf{U}}_i) = \bigcup_{j=1}^{M'} \mathcal{D}(U_{ij})$  where  $\mathcal{D}(U_{ij}) = \mathcal{D}'_j \times \mathcal{D}''_k$
- System  $\{(\bar{Q}(i), \mathcal{D}(\bar{\mathbf{U}}_i)) | i \in \llbracket N \rrbracket\}$  is  $(M'(n + \lceil \sqrt{n} \rceil), N, \lambda_1, \lambda_2)$  ID code and achieves acceptable **maximal error probabilities**

## Construction 2 (Concatenation)

**(Verdu & Wei):**

- Sequence of binary constant-weight code  $\{C_i\} = (S_i, N_i, M_i, \mu_i M_i)$  with weight factor  $\beta_i$ , second order rate  $\rho_i$  and pairwise overlap fraction  $\mu_i$  is **optimal for identification** if:
    - $\beta_i \rightarrow 1, \rho_i \rightarrow 1, \mu_i \rightarrow 0$
  - 3 layer concatenated code  $C_1 \circ C_2 \circ C_3$  denoted by  $[q, k, t]$  with:
    - $C_1 = [q]$  PPM (all binary  $q$ -vectors of unit weight)
    - $C_2 = [q, k]$  RS Code
    - $C_3 = [q^k, q^t]$  RS Code
    - $t \leq k \leq q = \text{prime}$
- is a  $(q^{k+2}, (q^k)^{q^t}, q^{k+1}, kq^k + q^{1+t})$  binary constant-weight code

## Construction 2 (Concatenation)

**(Verdu & Wei):**

- Let  $\{C_i\} = [q_i, k_i, t_i]$  be sequence of 3 layer concatenated codes, then  $\{C_i\}$  is **optimal for identification** if:
  - $t_i \rightarrow \infty$
  - $\frac{t_i}{k_i} \rightarrow 1$
  - $\frac{k_i}{q_i} \rightarrow 0$
  - $q_i^{t_i - k_i} \rightarrow 0$
- **Coupling** 3 layer concatenated code with a transmission code  $(n, e^{nR}, \lambda)$  gives an IT code which subsequently ID code can be extracted from !
- Error exponents of resulting ID code  $\rightarrow (\frac{1}{n} \log \frac{1}{\lambda}, \frac{1}{n} \log \frac{1}{\lambda + \mu})$

# Construction 3 (1 Layer RS Code)

**(Moulin & Koetter):**

- Let  $C = (n, |C|, d)_q$  be an EC code
- For word  $c_i = (c_i^1, \dots, c_i^n)$  let **enc/dec** set  $A_i = D_i$  is  $\{(u, c_i^u) | u \in [n]\}$
- $|A_i| = n, \quad |A_i \cap A_j| \leq n - d, \quad \forall i, j \in [|C|] \quad \rightarrow \mu_n = 1 - \frac{d}{n}$
- Let RS code  $(n \leq q - 1, k)$  over  $\mathbb{F}_q$  map  $(x_0, \dots, x_{k-1}) \in \mathbb{F}_q^k$  to  $(y_1, \dots, y_n) \in \mathbb{F}_q^n$  where  $y_i = \sum_{j=0}^{k-1} x_j \alpha_i^j$  where  $\alpha_i \in F = \{\alpha_1, \dots, \alpha_n\} \subset \mathbb{F}_q$
- $(x_0, \dots, x_{k-1}) \sim P = \sum_{j=0}^{k-1} x_j X^j \in \mathbb{F}_q[X]$
- Set  $A_P = \{(j, P(\alpha_j)) | j \in [n]\}$  for  $P \in \mathbb{F}_q[X]$
- Now **M-K-RS** ID code is defined by  $\{(A_p, A_p) | P \in \mathbb{F}_q[X], \deg(P) < k\}$
- Corresponding ID code is  $(\log_2 n + \log_2 q, q^k, 0, \frac{k-1}{n})$
- Application in **ContactLess Device (RFID tags) identification [Private Interrogation]**

# Construction 3 (1 Layer RS Code)

**(Moulin & Koetter):**

- Let message set  $\mathbb{M}$  have cardinality  $2^{rK}$ , where  $r = \varepsilon n$ , for some  $\varepsilon \in (0, 1)$
- **Partition** message  $m$  into  $K$  submessages  $m_1, \dots, m_K$
- Binary representation of  $m$  as  $r \times K$  matrix where  $m_u$  sits in the  $u$ -th column.

$$\mathbf{m} \sim \underbrace{\left( \begin{array}{cccc} 1 & 0 & 0 & \dots & 0 \\ 0 & 0 & 0 & \dots & 0 \\ 0 & 0 & 0 & \dots & 0 \\ \vdots & & & \ddots & \\ 0 & 0 & 0 & \dots & 0 \end{array} \right)}_K \Bigg\} r$$

- Encoding:
  - Generate RV  $u$  uniformly distributed over  $\{1, \dots, K\}$
  - Transmit ID word  $(u, m_u)$
- Parameters:
  - # of bits to represent  $\mathbf{a} = (u, m_u) = \log K + r$  where  $\log K = \frac{1-\varepsilon}{\varepsilon}r$
  - $\frac{1}{n} \log \log \mathbb{M} = 1 - \varepsilon + \frac{\log(\varepsilon n)}{n}$

# Construction 3 (1 Layer RS Code)

**(Moulin & Koetter):**

- Decoding:
  - RX observes output of noiseless channel  $\mathbf{b} = \mathbf{a} = (u, m_u)$
  - To test for the presence of message  $m^*$ , decoder compares if  $m_u = m_u^*$
- Performance:
  - $\mu_n = 0$  ☺
  - $\lambda_n = 1 - \frac{1}{K}$  ☹
- The need for **redundancy** → representation of message s.t. increase distance between different messages (measured via distinct columns)
- Simple idea → apply  $(L, K)$  RS code with alphabet size  $q = 2^r$  to message  $m$
- Performance:
  - $\mu_n = 0$  ☺
  - $\lambda_n = \frac{K}{L}$  ☺

# Remarks

- ID codes outperform **one exponential order more** than transmission codes by gaining reliable transmission of **double exponential** messages in blocklength
- **Double Exponent Coding Theorem** have been developed
- ID performance is measured by two errors namely **type I** and **type II**
- ID application → P2MP, remote alarm service,
- For infinite alphabet channel (**white Gaussian with bandwidth constraint**) or **DMC** ID and Shannon capacity coincide
- ID code for **noisy** channel → concatenation of standard transmission code and an ID code for **noiseless** channel
- Need for explicit construction of ID codes and Practical algorithms for implementation continues!
